The AVR instruction set is more orthogonal than those of most eight-bit microcontrollers, in particular the 8051 clones and PIC microcontrollers with which AVR competes today. However, it is not completely regular: Pointer registers X, Y, and Z have addressing capabilities that are different from each other.; Register locations R0 to R15 have more limited addressing capabilities than register ...This project deals with one of the application of vehicles. In this project one moving object is developed such that it is moved as per commands given by the voice recognition module and that command is received by microcontroller using wirelessWe have a huge collection of solutions and testbanks. We have been uploading solutions and testbanks but the product you are looking for may not have been uploaded yet.*Some lab experiments must be performed using any circuit simulation software e.g. PSPICE.
